

The Production of Space and Landscape

Modelling of archaeology in the landscape becomes more and more prominent in multidisciplinary research projects concerning material and human mobility, settlement dispersal, economy and exchange. However, a more holistic understanding of the interaction among human, material and environmental spheres in space requires consideration of the scale of previous mental and natural boundaries. What role did topography, a river system or a coastline play in the process of linking or separating groups and individuals and thus their relationships? An even bigger question is to what extent the perception of landscape in past times can be traced with a modern conception of space and time.

The first part of this conference focuses on the construction of space on different sociological and archaeological levels. Cognitive, material, anthropogenic and environmental spheres are not always and necessarily congruent.

The second part deals with applications, methodological approaches and solution strategies to access and model human behaviour in landscape. This section considers the possibility of differentiating landscapes into physical and cognitive categories.
